In benzene $\mathrm{e}^{-}$density is symmetrically distributed all C-atom therefore it readily undergo electrophilic aromatic substitution.
If we attach $\mathrm{e}^{-}$donating group on benzene ring then its $\mathrm{e}^{-}$density increases and its rate of electrophilic aromatic substitution increases and if we attach $\mathrm{e}^{-}$ withdrawing group on benzene ring its $\mathrm{e}^{-}$density decreases which decreases its rate of electrophilic aromatic substitution. In the reaction (II), due to the presence of $-\mathrm{NO}_{2}$ group stability of carbocation decreases which favours nucleophilic substitution reaction i.e., $\mathrm{SN}^{2}$

The extraction of copper from copper sulphide is mainly done through self reduction or auto reduction. In this process copper sulphide is get roasted in the presence of oxygen to produce copper oxide which on further reduction with copper sulphide gives rise to copper.
In this process due to evolution of $\mathrm{SO}_{2}$ the solidified copper formed has a blistered look and it is called as blister copper.
$2 \mathrm{Cu}_{2} \mathrm{~S}+3 \mathrm{O}_{2} \rightarrow 2 \mathrm{Cu}_{2} \mathrm{O}+2 \mathrm{SO}_{2}$
$2 \mathrm{Cu}_{2} \mathrm{O}+\mathrm{Cu}_{2} \mathrm{~S} \rightarrow 6 \mathrm{Cu}+\mathrm{SO}_{2}$

$\pi_{\text {glucose }}=\pi_{\mathrm{K}_{2} \mathrm{SO}_{4}}$ or $\mathrm{i} \times \mathrm{C}=\mathrm{i} \times \mathrm{C}$
for glucose $i=1, c=0.01 \mathrm{M}$
For $\mathrm{k}_{2} \mathrm{SO}_{4} \mathrm{i}=? c=0.004,1 \times 0.01=\mathrm{i} \times 0.004$
$i=\frac{0.01}{0.004}=\frac{5}{2}=2.5$
As $i=1+(\mathrm{n}-1) \alpha$
(For $\mathrm{K}_{2} \mathrm{SO}_{4} \mathrm{n}=3$ )
$2.5=1+(3-1) \alpha \Rightarrow 2.5=1+2 \alpha \Rightarrow \alpha=0.75$
Our percent dissociation $=\alpha \times 100 \%$
$=0.75 \times 100 \%=75 \%$

$$
\mathrm{Co}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \rightleftharpoons \mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})
$$

Initial 1 mole 1 mole - -
Equilibrium $1-x \quad 1-x \quad x \quad x$
Given at equilibrium $=40 \% \mathrm{H}_{2} \mathrm{O}$ by mass $\approx 0.4$ mole So mole of $\mathrm{CO}=$ mole of $\mathrm{H}_{2} \mathrm{O}=1-x$
$=1-0.4=0.6 \mathrm{~mol}$
Mole of $\mathrm{CO}_{2}=$ mole of $\mathrm{H}_{2}=x=0.4$ mole
$\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{CO}_{2}\right]\left[\mathrm{H}_{2}\right]}{[\mathrm{Co}]\left[\mathrm{H}_{2} \mathrm{O}\right]}=\frac{0.4 \times 0.4}{0.6 \times 0.6}=\frac{4}{9}$
$\mathrm{K}_{\mathrm{c}} \times 10^{2}=\frac{4}{9} \times 100=\frac{400}{9}=44.44 \approx 44$

## 26. Correct answer is [4].

Formula used $d=\frac{Z \times M}{N_{A} \times a^{3}}$
Given $\mathrm{d}=3 \mathrm{gm} / \mathrm{mL}, \mathrm{M}=12 \mathrm{gm} / \mathrm{mol}$
$\mathrm{A}=300 \mathrm{pm}=300 \times 10^{-10} \mathrm{~cm}$
By putting all the value in the given formula
$3 \mathrm{gm} / \mathrm{mL}=\frac{\mathrm{Z} \times 12 \mathrm{gm} / \mathrm{mol}}{6.02 \times 10^{23} \mathrm{~mol}^{-1} \times\left(300 \times 10^{-10}\right)^{3}}$
$\mathrm{Z}=\frac{3 \times 6.02 \times 10^{23} \mathrm{~mol}^{-1} \times\left(300 \times 10^{-10}\right)^{3}}{12}$
$=40.635 \times 10^{-1} \approx 4.0635 \approx 4$
27. Correct answer is [2].
