## JEE (Main) CHEMISTRY SOLVED PAPER

## Section A

Q.1. "A" obtained by Ostwald's method involving air oxidation of $\mathrm{NH}_{3}$, upon further air oxidation produces " $B$ ". " $B$ " on hydration forms an oxoacid of Nitrogen along with evolution of " A ". The oxoacid also produces " A " and gives positive brown ring test.
Identify A and B , respectively.
(1) $\mathrm{N}_{2} \mathrm{O}_{3}, \mathrm{NO}_{2}$
(2) $\mathrm{NO}_{2}, \mathrm{~N}_{2} \mathrm{O}_{4}$
(3) $\mathrm{NO}_{2}, \mathrm{~N}_{2} \mathrm{O}_{5}$
(4) $\mathrm{NO}, \mathrm{NO}_{2}$
Q. 2. Correct statement about smog is:
(1) Classical smog also has high concentration of oxidizing agents
(2) Both $\mathrm{NO}_{2}$ and $\mathrm{SO}_{2}$ are present in classical smog
(3) $\mathrm{NO}_{2}$ is present in classical smog
(4) Photochemical smog has high concentration of oxidizing agents
Q.3. The standard electrode potential $\left(\mathrm{M}^{3+} / \mathrm{M}^{2+}\right)$ for $\mathrm{V}, \mathrm{Cr}, \mathrm{Mn} \& \mathrm{Co}$ are $-0.26 \mathrm{~V},-0.41 \mathrm{~V},+1.57 \mathrm{~V}$ and +1.97 V , respectively. The metal ions which can liberate $\mathrm{H}_{2}$ from a dilute acid are
(1) $\mathrm{Mn}^{2+}$ and $\mathrm{Co}^{2+}$
(2) $\mathrm{Cr}^{2+}$ and $\mathrm{Co}^{2+}$
(3) $\mathrm{V}^{2+}$ and $\mathrm{Cr}^{2+}$
(4) $\mathrm{V}^{2+}$ and $\mathrm{Mn}^{2+}$
Q.4. The shortest wavelength of hydrogen atom in Lyman series is $\lambda$. The longest wavelength in Balmer series of $\mathrm{He}^{+}$is
(1) $\frac{36 \lambda}{5}$
(2) $\frac{9 \lambda}{5}$
(3) $\frac{5}{9 \lambda}$
(4) $\frac{5 \lambda}{9}$
Q. 5. The bond dissociation energy is highest for
(1) $\mathrm{F}_{2}$
(2) $\mathrm{Br}_{2}$
(3) $I_{2}$
(4) $\mathrm{Cl}_{2}$
Q.6. The increasing order of $\mathrm{pK}_{\mathrm{a}}$ for the following phenols is
(A) 2,4-Dinitrophenol
(B) 4-Nitrophenol
(C) 2,4,5 - Trimethylphenol
(D) Phenol
(E) 3-Chlorophenol

Choose the correct answer from the option given below:
(1) (A), (B), (E), (D), (C)
(2) (C), (D), (E), (B), (A)
(3) (A), (E), (B), (D), (C)
(4) (C), (E), (D), (B), (A)
Q. 7. For 1 mol of gas, the plot of $p V$ vs. $p$ is shown below. $p$ is the pressure and $V$ is the volume of the gas

What is the value of compressibility factor at point?
(1) $1+\frac{a}{R T V}$
(2) $1-\frac{a}{R T V}$
(3) $1+\frac{b}{b V}$
(4) $1-\frac{b}{V}$
Q. 8. Match List I with List II.

| List I <br> Antimicrobials | List II <br> Names |
| :--- | :--- |
| (A) Narrow Spec- <br> trum Antibiotic | (I) Furacin |
| (B) Antiseptic | (II) Sulphur dioxide |
| (C) Disinfectants | (III)Penicillin G |
| (D) Broad spectrum <br> antibiotic | (IV) Chloramphenicol |

Choose the correct answer from the options given below:
(1) (A) - II, (B) - I, (C) - IV, (D) - III
(2) (A) -I , (B) -II , (C) -IV , (D) - III
(3) (A) - II, (B) -I , (C) -IV, (D) - II
(4) (A) - III, (B) - I, (C) - II, (D) - IV
Q.9. During the borax bead test with $\mathrm{CuSO}_{4}$, a blue green colour of the bead was observed in oxidising flame due to the formation of
(1) CuO
(2) $\mathrm{Cu}\left(\mathrm{BO}_{2}\right)_{2}$
(3) $\mathrm{Cu}_{3} \mathrm{~B}_{2}$
(4) Cu
Q.10. Which of the following salt solution would coagulate the colloid solution formed when $\mathrm{FeCl}_{3}$ is added to NaOH solution, at the fastest rate?
(1) 10 mL of $0.1 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{Na}_{2} \mathrm{SO}_{4}$
(2) 10 mL of $0.2 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{AlCl}_{3}$
(3) 10 mL of $0.1 \mathrm{~mol} \mathrm{dm}{ }^{-3} \mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}$
(4) 10 mL of $0.15 \mathrm{~mol} \mathrm{dm}{ }^{-3} \mathrm{CaCl}_{2}$
Q.11. Number of cyclic tripeptides formed with 2 amino acids $A$ and $B$ is:
(1) 5
(2) 2
(3) 4
(4) 3
Q. 12. The correct order of hydration enthalpies is
(A) $\mathrm{K}^{+}$
(B) $\mathrm{Rb}^{+}$
(C) $\mathrm{Mg}^{2+}$
(D) $\mathrm{Cs}^{+}$
(E) $\mathrm{Ca}^{2+}$

Choose the correct answer from the options given below:
(1) E $>$ C $>$ A $>$ B $>$ D
(2) $\mathrm{C}>\mathrm{A}>$ E $>$ B $>$ D
(3) $\mathrm{C}>$ E $>$ A $>$ D $>$ B
(4) $\mathrm{C}>$ E $>$ A $>$ B $>$ D
Q. 13. Chiral complex from the following is:

Here en = ethylene diamine
(1) cis $^{-}\left[\mathrm{PtCl}_{2}(\mathrm{en})_{2}\right]^{2+}$
(2) trans $-\left[\mathrm{PtCl}_{2}(\mathrm{en})_{2}\right]^{2+}$
(3) cis - $\left[\mathrm{PtCl}_{2}\left(\mathrm{NH}_{3}\right)_{2}\right]$
(4) trans - $\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{4} \mathrm{Cl}_{2}\right]^{+}$
Q. 14. Identify the correct order for the given property for following compounds.
(A) Boiling Point:
(B) Density:

(C) Boiling Point:

(D) Density:

(E) Boiling Point:

Choose the correct answer from the option given below:
(1) (B), (C) and (D) only
(2) (A), (C) and (D) only
(3) (A), (B) and (E) only
(4) (A), (C) and (E) only
Q. 15. The magnetic behavior of $\mathrm{Li}_{2} \mathrm{O}, \mathrm{Na}_{2} \mathrm{O}_{2}$ and $\mathrm{KO}_{2}$, respectively, are
(1) Paramagnetic, paramagnetic and diamagnetic
(2) diamagnetic, paramagnetic and diamagnetic
(3) paramagnetic, diamagnetic and paramagnetic
(4) diamagnetic, diamagnetic and paramagnetic
Q.16. The reaction representing the Mond process for metal refining is
(1) $\mathrm{ZnO} \mathrm{ZnO}+\mathrm{C} \xrightarrow{\Delta} \mathrm{Zn}+\mathrm{CO}$
(2) $\mathrm{Zr}+2 \mathrm{I}_{2} \xrightarrow{\Delta} \mathrm{ZrI}_{4}$
(3) $2 \mathrm{~K}\left[\mathrm{Au}(\mathrm{CN})_{2}\right]+\mathrm{Zn} \xrightarrow{\Delta} \mathrm{K}_{2}\left[\mathrm{Zn}(\mathrm{CN})_{4}\right]+$ 2 Au
(4) $\mathrm{Ni}+4 \mathrm{CO} \xrightarrow{\Delta} \mathrm{Ni}(\mathrm{CO})_{4}$
Q. 17. Which of the given compounds can enhance the efficiency of hydrogen storage tank?
(1) Di - isobutylaluminium hydride
(2) $\mathrm{NaNi}_{5}$
(3) $\mathrm{Li} / \mathrm{P}_{4}$
(4) $\mathrm{SiH}_{4}$
Q. 18. Match List I with List II.

| List I <br> Reaction |  | List II <br> Reagents |
| :--- | :--- | :--- |
| (A) Hoffmann <br> Degradation | (I)Conc. KOH, <br> (B) Clemensen reduction(II)$\mathrm{CHCl}_{3}, \mathrm{NaOH} /$ <br> $\mathrm{H}_{3} \mathrm{O}^{+} \mathrm{O}^{\oplus}$ |  |

| (C) Cannizaro reaction | (III) $\mathrm{Br}_{2}, \mathrm{NaOH}$ |
| :--- | :--- |
| (D) Reimer - Tiemann <br> Reaction | (IV) $\mathrm{Zn}-\mathrm{Hg} / \mathrm{HCl}$ |

Choose the correct answer from the options given below:
(1) (A) - III, (B) -IV , (C) -I , (D) - II
(2) (A) - II, (B) -I , (C) -III , (D) - IV
(3) (A) - III, (B) -IV , (C) -II, (D) -I
(4) (A) -II, (B) - IV, (C) - I, (D) - III
Q. 19. The major product ' $P$ ' for the following sequence of reactions is:

(1)

(2)

(3)

(4)

Q. 20. Compound that will give positive Lassaigne's test for both nitrogen and halogen is:
(1) $\mathrm{NH}_{2} \mathrm{OH} . \mathrm{HCl}$
(2) $\mathrm{CH}_{3} \mathrm{NH}_{2} \cdot \mathrm{HCl}$
(3) $\mathrm{NH}_{4} \mathrm{Cl}$
(4) $\mathrm{N}_{2} \mathrm{H}_{4} \cdot \mathrm{HCl}$

## Section B

Q.21. Millimoles of calcium hydroxide required to produce 100 mL of the aqueous solution of pH 12 is $x \times 10^{-1}$. The value of $x$ is $\qquad$ (Nearest integer).
Assume complete dissociation.
Q. 22. Water decomposes at 2300 K
$\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g})$
The percent of water decomposing at 2300 K and 1 bar is $\qquad$ (Nearest integer).
Equilibrium constant for the reaction is $2 \times 10^{-3}$ at 2300 K .
Q. 23. The sum of bridging carbonyls in $\mathrm{W}(\mathrm{CO})_{6}$ and $\mathrm{Mn}_{2}(\mathrm{CO})_{10}$ is $\qquad$ .
Q. 24. Solid Lead nitrate is dissolved in 1 litre of water. The solution was found to boil at $100.15^{\circ} \mathrm{C}$. When 0.2 mol of NaCl is added to the resulting solution, it was observed that the solution froze at $-0.8^{\circ} \mathrm{C}$. The solubility product of $\mathrm{PbCl}_{2}$ formed is $\qquad$ $\times$ $10^{-6}$ at 298 K . (Nearest integer)
(Given: $\mathrm{K}_{\mathrm{b}}=0.5 \mathrm{~K} \mathrm{kgmol}^{-1}$ and $\mathrm{K}_{\mathrm{f}}=1.8 \mathrm{~K} \mathrm{~kg}$ $\mathrm{mol}^{-1}$. Assume molality to be equal to molarity in all cases.)
Q.25. 17 mg of a hydrocarbon (M.F. $\mathrm{C}_{10} \mathrm{H}_{16}$ ) takes up 8.40 mL of the $\mathrm{H}_{2}$ gas measured at $0^{\circ} \mathrm{C}$ and 760 mm of Hg . Ozonolysis of the same hydrocarbon yields

The number of double bond/s present in the hydrocarbon is
Q.26. Consider the following reaction approaching equilibrium at $27^{\circ} \mathrm{C}$ and 1 atm pressure

$$
A+B \underset{k_{f}=10^{2}}{\stackrel{K_{f}=10^{3}}{\rightleftharpoons} C+D ~}
$$

The standard Gibb's energy change $\left(\Delta_{\mathrm{r}} \mathrm{G}^{\theta}\right)$ at $27^{\circ} \mathrm{C}$ is $(-)$ $\qquad$ $\mathrm{kJ} \mathrm{mol}^{-1}$
(Nearest integer).
(Given: $\mathrm{R}=8.3 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$ and $\ln 10=2.3$ )
Q.27. The number of molecules or ions from the following, which do not have odd number of electrons are $\qquad$
(A) $\mathrm{NO}_{2}$
(B) $\mathrm{ICI}_{4}^{-}$
(C) $\mathrm{BrF}_{3}$
(D) $\mathrm{ClO}_{2}$
(E) $\mathrm{NO}_{2}^{+}$
(F) NO
Q.28. Following chromatogram was developed by adsorption of compound 'A' on a 6 cm TLC glass plate.
Retardation factor of the compound ' A ' is $\qquad$ $\times$ $10^{-1}$

Q. 29. For certain chemical reaction $X \rightarrow Y$, the rate of formation of product is plotted against the time as shown in the figure. The number of correct statement/s from the following is

(A) Over all order of this reaction is one
(B) Order of this reaction can't be determined
(C) In region I and III, the reaction is of first and zero order respectively
(D) In region - II, the reaction is of first order
(E) In region - II, the order of reaction is in the range of 0.1 to 0.9 .
Q.30. Following figure shows dependence of molar conductance of two electrolytes on concentration. $\Lambda \mathrm{m}$ is the limiting molar conductivity.

The number of incorrect statement(s) from the following is
(A) $\Lambda \mathrm{m}$ for electrolyte A is obtained by extrapolation
(B) For electrolyte B, $\Lambda m$ vs $\sqrt{c}$ graph is a straight line with intercept equal to $\Lambda \mathrm{m}$
(C) At infinite dilution, the value of degree of dissociation approaches zero for electrolyte $B$.
(D) $\Lambda \mathrm{m}$ for any electrolyte $A$ or $B$ can be calculated using $\lambda^{\circ}$ for individual ions

## Answer Key

| Q. No. | Answer | Topic Name | Chapter Name |
| :---: | :---: | :--- | :--- |
| $\mathbf{1}$ | $\mathbf{( 4 )}$ | Ostwald process | P block |
| $\mathbf{2}$ | $\mathbf{( 4 )}$ | Smog formation | Environmental chemistry |
| $\mathbf{3}$ | $\mathbf{( 3 )}$ | Standard electrode potential | Electro chemistry |
| $\mathbf{4}$ | $\mathbf{( 2 )}$ | Hydrogen spectrum | Structure of atom |
| $\mathbf{5}$ | $\mathbf{( 4 )}$ | Bond energy | P block |
| $\mathbf{6}$ | $\mathbf{( 1 )}$ | Acidic nature of phenol | Alcohol ether and phenol |
| $\mathbf{7}$ | $\mathbf{( 2 )}$ | Compressibility factor | States of matter |
| $\mathbf{8}$ | $\mathbf{( 4 )}$ | Classification of drugs | Chemistry in every day life |
| $\mathbf{9}$ | $\mathbf{( 2 )}$ | Borax bead test | Qualitative analysis |
| $\mathbf{1 0}$ | $\mathbf{( 2 )}$ | Coagulation value | Surface chemistry |
| $\mathbf{1 1}$ | $\mathbf{( 3 )}$ | Number of cyclic peptides | Biomolecules |
| $\mathbf{1 2}$ | $\mathbf{( 4 )}$ | Hydration enthalpy | S block |
| $\mathbf{1 3}$ | $\mathbf{( 1 )}$ | Chiral complex | Coordination chemistry |

| $\mathbf{1 4}$ | $\mathbf{( 4 )}$ | Physical properties of halo Alkane | Alkyl and aryl halides |
| :--- | :---: | :--- | :--- |
| $\mathbf{1 5}$ | $\mathbf{( 4 )}$ | Magnetic substances of metal oxides | S block |
| $\mathbf{1 6}$ | $\mathbf{( 4 )}$ | Refining of metals | Metallurgy |
| $\mathbf{1 7}$ | $\mathbf{( 2 )}$ | Efficiency of hydrogen | Hydrogen |
| $\mathbf{1 8}$ | $\mathbf{( 1 )}$ | Mixed name reaction | Amines, aldehyde and ketones |
| $\mathbf{1 9}$ | $\mathbf{( 4 )}$ | Clemmensen reduction | Aldehyde and ketone |
| 20 | $\mathbf{( 2 )}$ | Lassaigne test | Qualitative analysis |
| 21 | $[5]$ | pH of the solution | Ionic equilibrium |
| 22 | $[2]$ | Percentage dissociation | Equilibrium |
| 23 | $[0]$ | Carbonyl compounds | Coordination chemistry |
| 24 | $[13]$ | Solubility products | Ionicequilibrium |
| 25 | $[3]$ | Ozonolysis of organic compounds | Hydrocarbons |
| 26 | $[6]$ | Standard Gibbs energy change | Thermodynamics |
| 27 | $[3]$ | Number of electrons in a molecule | Chemical bonding |
| 28 | $[6]$ | Chromatography technique | General organic chemistry |
| 29 | $[1]$ | Order of reaction. | Chemical kinetics |
| 30 | $[2]$ | Limiting molar conductivity | Electrochemistry |

## Solutions

## Section A

## 1. Option (4) is correct.

In an ostwald process, formation of nitric acid takes place.
The formation of nitric acid takes place via following steps
(1) $4 \mathrm{NH}_{3}+5 \mathrm{O}_{2} \rightarrow 4 \mathrm{NO}+6 \mathrm{H}_{2} \mathrm{O}$
(2) $2 \mathrm{NO}+\mathrm{O}_{2} \rightarrow 2 \mathrm{NO}_{2}$
(A)
(B)
(3) $3 \mathrm{NO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{HNO}_{3}+\mathrm{NO}$
(A)
2. Option (4) is correct.

Classical smog contain smoke, fog and $\mathrm{SO}_{2} \mathrm{smog}$ and it is known as reducing smog because here $\mathrm{SO}_{2}$ acts as reducing agent.
Similarly $\mathrm{NO}_{2}$ is produced when NO and $\mathrm{O}_{3}$ reacts together in presence of sunlight.
Photochemical smog has high concentration of oxidizing agent. Therefore it is also known as oxidising smog. The main components result from the action of sunlight on unsaturated hydrocarbon \& nitrogen oxides produced by automobile \& factories.
3. Option (3) is correct.

| Given | Element | $\mathrm{E}_{\frac{\mathrm{M}^{3+}}{\mathrm{M}^{2+}}}^{0}$ |
| :---: | :---: | :---: |
|  | V | -0.26 V |
|  | Cr | $-0.41 \mathrm{~V}$ |
|  | Mn | $+1.57 \mathrm{~V}$ |
|  | Co | +1.97 V |

We know that,
The metal ion which have less value of standard reduction potential can easily releases $\mathrm{H}_{2}$ gas on reaction with dilute acid.
Here the value of $\mathrm{V}^{2+}$ and $\mathrm{Cr}^{2+}$ are -0.26 V and 0 . 41 V respectively which is less compared to the
standard reduction potential of $\mathrm{H}_{2}$, so both ion are capable of releasing $\mathrm{H}_{2}$ gas on reaction with dilute acid.
4. Option (2) is correct.

Formula wed
$\bar{v}=\frac{1}{\lambda}=\mathrm{R}_{\mathrm{H}} \times \mathrm{Z}^{2}\left(\frac{1}{\mathrm{n}_{1}^{2}}-\frac{1}{\mathrm{n}_{2}^{2}}\right)$
Where $\mathrm{Z}=$ atomic number
$n_{1}=$ Lower energy state
$n_{2}=$ Higher energy state
$\mathrm{R}_{\mathrm{H}}=$ Rydberg constant
For Lyman series (shortest wavelength)
$n_{1}=1, n_{2}=\infty$
For H: $\frac{1}{\lambda}=R_{H} \times 1^{2}\left(\frac{1}{1^{2}}-\frac{1}{\infty^{2}}\right)$
For Balmer series (longest wavelength)
$n_{1}=2, n_{2}=3$
For $\mathrm{He}^{+}: \frac{1}{\lambda}=\mathrm{R}_{\mathrm{H}} \times 2^{2}\left(\frac{1}{2^{2}}-\frac{1}{3^{2}}\right)$
From i \& ii

$$
\frac{\lambda_{\mathrm{He}^{+}}}{\lambda_{\mathrm{H}}}=\frac{9}{5} \text { or } \quad \lambda_{\mathrm{He}^{+}}=\frac{9 \lambda}{5}
$$

5. Option (4) is correct.

The decreasing order of bond energy of halogen is as follows
$\mathrm{Cl}_{2}>\mathrm{Br}_{2}>\mathrm{F}_{2}>\mathrm{I}_{2}$
The general trend of bond energy is that it decreases down the groups due to increases in atomic sige. but The bond energy of $\mathrm{F}_{2}$ is less than $\mathrm{Cl}_{2}$ due to lone pair - lone pair repulsion because the size of fluorine atom is very small as compared to chlorine atom.
6. Option (1) is correct.

The Structure of the given phenol is
(A)

(B)

(C)

(D)

(E)

Here $-\mathrm{NO}_{2}$ and -CI are $\mathrm{e}^{-}$(withdrawing) group which decreases the $\mathrm{e}^{-}$density of benzene ring while $-\mathrm{CH}_{3}$ is $\mathrm{e}^{-}$donating group which increases the $\mathrm{e}^{-}$ density of benzene ring.
$\mathrm{e}^{-}$donating group decreases the acidic nature while the $\mathrm{e}^{-}$withdrawing group increases the acidic nature. The relation between acidic nature and the value of pka is as follows -
Strength of acidic nature $\propto K a \propto \frac{1}{\text { pka }}$

(E)
7. Option (2) is correct.

For 1 more of gas
$Z=\frac{P V}{R T} Z$ represent compressibility factor
In the given graph, point A represent low pressure and high volume.
From Vander waal gas equation.

$$
\left(\mathrm{P}+\frac{\mathrm{an}^{2}}{\mathrm{~V}^{2}}\right)(\mathrm{V}-\mathrm{nb})=\mathrm{nRT}
$$

At point $\mathrm{A}, \mathrm{V}$ is very high $\therefore \mathrm{b}$ Can be neglected. For one more equation can be represented as-

$$
\begin{gathered}
\left(\mathrm{P}+\frac{\mathrm{a}}{\mathrm{~V}^{2}}\right)(\mathrm{V})=\mathrm{RT} \\
\mathrm{P} \mathrm{v}+\frac{\mathrm{a}}{\mathrm{~V}}=\mathrm{RT} \\
\text { Divide whole } \mathrm{eq}^{\mathrm{n}} \text { by RT } \\
\frac{\mathrm{PV}}{\mathrm{RT}}+\frac{\mathrm{a}}{\mathrm{RTV}}=\frac{\mathrm{RT}}{\mathrm{RT}} \\
\mathrm{Z}+\frac{\mathrm{a}}{\mathrm{RTV}}=1 \\
\text { Or } \quad \mathrm{Z}=1-\frac{\mathrm{a}}{\mathrm{RTV}}
\end{gathered}
$$

8. Option (4) is correct.

|  | Antimicrobial |  | Names |
| :--- | :--- | :--- | :--- |
| A. | Narrow Spectrum <br> Antibiotic | III. | Penicillin-G |
| B. | Antiseptic | I. | Furacin |
| C. | Disinfectants | II. | Sulphur dioxide |
| D. | Broad Spectrum <br> antibiotic | IV. | Chloramphenicol |

9. Option (2) is correct.

Borax bead test is an example of dry test in which metal ion reacts with a sample of borax $\left(\mathrm{Na}_{2} \mathrm{~B}_{4} \mathrm{O}_{7}\right.$. $10 \mathrm{H}_{2} \mathrm{O}$ ) which gives characteristics colour beads.

$$
\begin{aligned}
\mathrm{Na}_{2} \mathrm{~B}_{4} \mathrm{O}_{7} \xrightarrow{\Delta} & 2 \mathrm{NaBO}_{2}+\mathrm{B}_{2} \mathrm{O}_{3} \\
\mathrm{CuSO}_{4} \xrightarrow{\Delta} & \mathrm{CuO}+\mathrm{SO}_{3} \\
\mathrm{CuO}+\mathrm{B}_{2} \mathrm{O}_{3} \rightarrow & \mathrm{Cu}\left(\mathrm{BO}_{2}\right)_{2} \\
& \begin{array}{c}
\text { Copper (II) metaborate } \\
\text { (blue-green color) }
\end{array}
\end{aligned}
$$

10. Option (2) is correct.

When $\mathrm{FeCl}_{3}$ is added to NaOH solution formation of negatively charged sol takes place.
$\mathrm{FeCl}_{3}+\mathrm{NaOH} \rightarrow \mathrm{Fe}(\mathrm{OH})_{3} / \mathrm{OH}^{-}$
The precipitation / coagulation of above negatively charged sol mainly takes place in the presence of positive ion and it can be done at faster rate when number of positive charge on ion is maximum $\therefore$ 10 ml of $0.2 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{AlCl}_{3}$ coagulate at faster rate.
11. Option (3) is correct.

The Possible number of cyclic tripeptides formed with this amino acid $A$ and $B$ are as follow

12. Option (4) is correct.

When an ion dissolves into water, then the ion is surrounded with water molecule via ion dipole interaction, this phenomenon is known as hydration and the energy released is known as hydration energy,
The magnitude of hydration energy depends on the following factor

Size of ion $\propto \frac{1}{\text { hydration energy }}$
Number of charges $\propto$ Hydration energy.
Among the given ions $\mathrm{Mg}^{2+}$ having smallest size and high charge density while $\mathrm{Cs}^{+}$having largest size and the less charge density.
The correct order of hydration enthalpies is-
$\mathrm{Mg}^{2+}>\mathrm{Ca}^{2+}>\mathrm{K}^{+}>\mathrm{Rb}^{+}>\mathrm{Cs}^{+}$
(C)
(E)
(A)
(B) (D)
13. Option (1) is correct.

Chiral complex are those complex which have non (superimposable) mirror images and form optically active molecule

cis $-\left[\mathrm{Pt} \mathrm{Cl}_{2}(\mathrm{en})_{2}\right]^{2+}$ is an optically active molecule.
14. Option (4) is correct.

The boiling point alkyl halide depends on the following factor-
(a) Size of halogen atom

Boiling point $\propto$ size of halogen atom
(b) Mass of halogen atom

Boiling point $\propto$ mass of halogen atom
(c) Number of halogen atom

Boiling point $\propto$ Number of halogen atom
(d) Branching

Boiling point $\propto \frac{1}{\text { Branching }}$
(e) Number of C-atom in main chain.

Boiling point $\propto$ No of c -atom in main chain Order (A) is correct order, where number of C-atom increases in a main chain

Order (B) is correct, the density of alkyl halide increases with the mass of halogen atom and size of main chain.
Order (C) is correct.
Boiling point $\propto$ No. of halogen atom.
Order (D) is incorrect the density of alkyl halide increases with the mass of halogen atom and size of main chain.
Order (E) is correct
Boiling point $\propto \frac{1}{\text { Branching }}$

15. Option (4) is correct.

Species Ionic species $\quad$ Number of unpaired e ${ }^{-}$

|  |  | Magnetic Nature |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{Li}_{2} \mathrm{O}$ | $\mathrm{O}^{2-}$ | 0 | Diamagnetic |
| $\mathrm{Na}_{2} \mathrm{O}_{2}$ | $\mathrm{O}_{2}^{2-}$ (Peroxidide) | 0 | Diamagnetic |
| $\mathrm{KO}_{2}$ | $\mathrm{O}_{2}^{-}$(Superoxide) | 1 | Paramagnetic |

## 16. Option (4) is correct.

Mond process is an example of vapour phase refining in which metal is converted into its volatile compound \& collected elsewhere when then decomposed to give pure metal,
Here, nickel is heated in a stream of carbon monoxide (CO) to form volatile complex, nickel tetracarbonyl
$\mathrm{Ni}+4 \mathrm{CO} \xrightarrow{330-350 \mathrm{~K}} \mathrm{Ni}(\mathrm{CO})_{4}$
The carbonyl is subjected to higher temperature so it is decomposed to give pure metal

$$
\mathrm{Ni}(\mathrm{CO})_{4} \xrightarrow{450-470 \mathrm{~K}} \mathrm{Ni}+4 \mathrm{CO}
$$

## 17. Option (2) is correct.

$\mathrm{H}_{2}$ gas is converted into liquid state by cooling to 20 K , it would require expensive insulated tanks of metal alloy like $\mathrm{NaNi}_{5}, \mathrm{Ti}-\mathrm{Ti} \mathrm{H}_{2}, \mathrm{Mg}-\mathrm{MgH}_{2}$ etc.
18. Option (1) is correct.

|  | Reaction |  | Reagent used |
| :--- | :--- | :--- | :--- |
| A. | Hofmann <br> degradation | III. | $\mathrm{Br}_{2} / \mathrm{NaOH}$ |
| B. | Clemensen <br> reduction | IV. | $\mathrm{Zn}-\mathrm{Hg} / \mathrm{HCI}$ |
| C. | Cannizaro <br> reaction | I. | conc. $\mathrm{KOH}, \Delta$ |
| D. | Reimer - <br> Tiemann <br> reaction | II. | $\mathrm{CHCl}_{3}, \mathrm{NaOH} / \mathrm{H}_{3} \mathrm{O}^{+}$ |

19. Option (4) is correct.

The reduction of carbonyl group takes place via $\mathrm{Zn}-$ $\mathrm{Hg} / \mathrm{HCl}$ while reduction of amide $\left(-\mathrm{CONH}_{2}\right)$ group takes place by $\mathrm{LiAlH}_{4} / \mathrm{H}_{3} \mathrm{O}^{+}$

20. Option (2) is correct.

Lassaigne's test is used for The detection of N , sand heloged in an organic compound.
$\mathrm{CH}_{3} \mathrm{NH}_{2} \cdot \mathrm{HCl}$ gives positive Lassaigne's test for both nitrogen and halogen.

NaCN gives positive test for nitrogen while Nacl give positive test for halogen.

## Section B

21. The correct answer is [5].

Given $\mathrm{pH}=12$
From $\mathrm{pH}+\mathrm{pOH}=14$
$\mathrm{POH}=14-12=2$
$\mathrm{POH}=-\log \left[\mathrm{OH}^{-}\right]$
$[\overline{\mathrm{O}} \mathrm{H}]-10^{-2} \mathrm{~N}$

$$
\begin{aligned}
\text { Molarity of } \mathrm{Ca}(\mathrm{OH})_{2} & =\frac{\text { Normality }}{\mathrm{V} f} \\
& =\frac{10^{-2}}{2}=5 \times 10^{-3} \mathrm{M}
\end{aligned}
$$

molarity of $\mathrm{Ca}(\mathrm{OH})_{2}=$ moles of $\mathrm{Ca}(\mathrm{OH})_{2}$

$$
\text { moleo of } \mathrm{Ca}(\mathrm{OH})_{2}=5 \times 10^{-3} \mathrm{M}
$$

millimoles of $\mathrm{Ca}(\mathrm{OH})_{2}=5 \times 10^{-3} \times 1000$

$$
=5 \text { millimoles }
$$

In 1000 mL , Millimoles of $\mathrm{Ca}(\mathrm{OH})_{2}=5 \mathrm{mmol}$

$$
\text { So } \begin{aligned}
100 \mathrm{~mL} \text {, millimoles of } \mathrm{Ca}(\mathrm{OH})_{2} & =\frac{5 \times 100}{1000} \\
& =0.5 \\
& \approx 5 \times 10^{-1} \mathrm{mmol}
\end{aligned}
$$

22. The correct answer is [2].

Let the degree of dissociation be x and the initial pressure $=1$ bar

$$
\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \longleftrightarrow \mathrm{H}_{2(\mathrm{~g})}+\frac{1}{2} \mathrm{O}_{2(\mathrm{~g})}
$$

Initial (bar)
Equilibrium (bar)

$$
\begin{aligned}
\mathrm{K}_{\mathrm{P}} & =\frac{\left(\mathrm{P}_{\mathrm{H}_{2}}\right)\left(\mathrm{P}_{\mathrm{O}_{2}}\right)^{\frac{1}{2}}}{\mathrm{P}_{\mathrm{H}_{2} \mathrm{O}}} \\
2 \times 10^{-3} & =\frac{x \times\left(\frac{x}{2}\right)^{\frac{1}{2}}}{(1-x)}
\end{aligned}
$$

As $\quad 1-x \approx 1$
So $2 \times 10^{-3}=\frac{x \times \sqrt{x}}{\sqrt{2}}$
On Solving $\mathrm{x}=2 \times 10^{-2}$
Percent dissociation $=x \times 100 \%$

$$
\begin{aligned}
& =2 \times 10^{-2} \times 100 \\
& =2 \%
\end{aligned}
$$

23. The correct answer is [0].

The structure of $\mathrm{W}(\mathrm{CO})_{6}$

Number of bridge CO = zero (0)
The structure of $\mathrm{Mn}_{2}(\mathrm{CO})_{10}$

Number of bridge CO = Zero (0)
The sum of bridging carbonyl in $\mathrm{W}(\mathrm{CO})_{6}$ and $\mathrm{Mn}_{2}(\mathrm{CO})_{10}$ are zero.
24. The correct answer is [13].
$\mathrm{PbCl}_{2}$ is a sparingly soluble salt where solubility decreases on addition of strong electrolyte $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ due to common ion effect.
Let $x$ mole $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ is added.
$\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2} \rightarrow \mathrm{~Pb}^{2+}+2 \mathrm{NO}_{3}^{-}$
From $\Delta \mathrm{T}_{\mathrm{b}}=\mathrm{K}_{\mathrm{b}} \mathrm{m}$

$$
\Delta \mathrm{T}_{\mathrm{b}}=0.15 \mathrm{~K}_{\mathrm{b}}=0.5
$$

$\mathrm{m}=\frac{3 \mathrm{xmole}}{1 \mathrm{~L}}=3 x$
$0.15=3 x \times 0.5$
$0.15=1.5 x$

$$
x=\frac{0.15}{1.5}=0.1
$$

Given 0.2 mole NaCl
$\mathrm{NaCl} \rightarrow \mathrm{Na}^{+}+\mathrm{Cl}^{-}$
0.2

Now for $\mathrm{PbCl}_{2}$
$\mathrm{Pb}^{2+}+2 \mathrm{Cl}^{-} \rightarrow \mathrm{PbCl}_{2(\mathrm{~s})}$
$0.1 \quad 0.2$
$\mathrm{t}=0$
$\mathrm{t}=\infty \quad 0.1-x \quad 0.2-2 x$
In the Final Solution

$$
\begin{aligned}
\Delta \mathrm{T}_{\mathrm{f}} & =\mathrm{K}_{\mathrm{f}} \mathrm{~m} \\
0.8 & =1.8 \times\left[\frac{0.3-3 x+0.2+0.2}{1}\right] \\
x & =\frac{2.3}{27}
\end{aligned}
$$

$\left[\mathrm{Pb}^{2+}\right]=0.1-\left[\mathrm{Cl}^{-}\right]=0.2-2 \times \frac{2.3}{27}$
$\mathrm{~K}_{\mathrm{SP}}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{Cl}^{-}\right]^{2}$
$K_{S p}=\left(0.1-\frac{2.3}{27}\right)\left(0.2-\frac{4.6}{27}\right)^{2}=13 \times 10^{-6}$
$K_{s p}=13 \times 10^{-6}$
25. The correct answer is [3].

Molar Mass of Hydrocarbon $=10(\mathrm{C}) \times 12+16(\mathrm{H}) \times 1$

$$
=120+16=136 \mathrm{~g}
$$

Mass of hydrocarbon $=17 \mathrm{mg}$

$$
=17 \times 10^{-3} \mathrm{~g}
$$

Number of moles of Hydrocarbon

$$
\begin{aligned}
\left(\text { M. F. }=\mathrm{C}_{10} \mathrm{H}_{16}\right) & =\frac{\text { mass }}{\text { MolarMass }} \\
& =\frac{17 \times 10^{-3} \mathrm{~g}}{136}=1.25 \times 10^{-4}
\end{aligned}
$$

Moles of $\mathrm{H}_{2}$ gas can be calculated by using ideal gas equation
$\mathrm{PV}=\mathrm{nRT}$
$\mathrm{P}=760 \mathrm{mmHg}=1 \mathrm{~atm}$
$\mathrm{V}=8.40 \mathrm{~mL}=8.4 \times 10^{-3} \mathrm{~L}$
$\mathrm{T}=0^{0} \mathrm{C}=273 \mathrm{~K}$
$\mathrm{R}=0.0821 \frac{\mathrm{~L} \times \mathrm{atm}}{\mathrm{K} \times \mathrm{mol}}$
$\mathrm{n}=\frac{\mathrm{PV}}{\mathrm{RT}}=\frac{1 \mathrm{~atm} \times 8.4 \times 10^{-3} \mathrm{~L}}{0.0821 \frac{\mathrm{~L} \times \mathrm{atm}}{\mathrm{Kmol}} \times 273 \mathrm{~K}}$
$\mathrm{n}=3.75 \times 10^{-4}$ mole
No. of double bond $=\frac{\text { No of mol of } \mathrm{H}_{2}}{\text { No.of moe of hydrocarbon }}$

$$
=\frac{3.75 \times 10^{-4}}{1.25 \times 10^{-4}}=3
$$

26. The correct answer is [6].

From $\Delta \mathrm{G}^{0}=-2.303 R T \log K$

$$
K=\frac{K_{f}}{K_{b}}
$$

Given $\quad K_{f}=10^{3} \quad K_{b}=10^{2}$

$$
K=\frac{10^{3}}{10^{2}}=10
$$

$$
\Delta \mathrm{G}^{0}=-2.303 R \mathrm{R} \log \mathrm{~K}
$$

$$
=-2.303 \times 8.314 \times 300 \times \log 10
$$

$$
=-5744 \mathrm{~J} / \mathrm{mol}
$$

$\Delta \mathrm{G}^{0} \approx-5.744 \mathrm{~kJ} / \mathrm{mol}$
$\Delta G^{0} \approx-6 \mathrm{~kJ} / \mathrm{mol}$
27. The correct answer is [3].

| Species | Structure | No. of Odd $\mathrm{e}^{-}$ |
| :---: | :---: | :---: |
| $\mathrm{NO}_{2}$ |  | 1 |
| $\mathrm{ICl}_{4}^{-}$ |  | 0 |

$\mathrm{ClO}_{2}$

$\mathrm{NO}_{2}$

$$
\begin{gathered}
\mathrm{O}=\stackrel{\oplus}{\mathrm{N}} \rightarrow \mathrm{O} \\
: \dot{\mathrm{N}}=\mathrm{O}
\end{gathered}
$$

1

0
1

From the given species $\mathrm{ICl}_{4}^{-}, \mathrm{BrF}_{3}$ and $\mathrm{NO}_{2}^{\oplus}$ do not have odd number of $\mathrm{e}^{-}$.
28. The correct answer is [6].
$\mathrm{R}_{\mathrm{f}}=\frac{\text { Distance moved by the substance from base line }}{\text { Distance moved by solvent from baseline }}$

$$
=\frac{3.0 \mathrm{~cm}}{5.0 \mathrm{~cm}}=0.6 \approx 6 \times 10^{-1}
$$

29. The correct answer is [1].

In region I and II, slope of the graph is positive, So the reaction has a nagative order.
In region III, slope of the graph is zero, So the order of the reaction is zero.
$\therefore$ Order of the reaction can't be determind.
30. The correct answer is [2].

Statement (A) is incorrect.
$\wedge_{M}^{0}$ for electrolyte (A) can't be obtained by extrapolation.
Statement (C) is incorrect.
At infinite dilution, the value of degree of dissociation cannot approaches zero for electrolyte B.
At infinite dilution, the degree of dissociation of each \& every electrolyte approaches to $100 \%$ and they behave as strong electrolyte.
