## Solutions

## Section A

1. Option (1) is correct.

- The solvent extraction method is used to separate liquids with the difference in densities. The density of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ is greater than the density of water.
- The p-nitrophenol has intermolecular H-bonding. Hence, it is separated by column chromatography
- Kerosene and naphthalene are separated by fractional distillation due to the difference in the boiling points.
- NaCl is an ionic compound and $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ is a covalent compound. $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ is soluble in an organic solvent. Hence, they can be separated by crystallization.

2. Option (1) is correct.

3. Option (3) is correct.

As the compound burns with the sooty flame, the compound is phenol (aromatic compound). In the presence of a solvent of low polarities, such as $\mathrm{CHCl}_{3}$ or $\mathrm{CS}_{2}$, it reacts with bromine to form a p-bromophenol as a major product.

4. Option (4) is correct.
$\mathrm{X}=\mathrm{Cu}_{2} \mathrm{I}_{2}, \mathrm{Y}=\mathrm{Na}_{2} \mathrm{~S}_{4} \mathrm{O}_{6}$
$2 \mathrm{CuSO}_{4}+4 \mathrm{KI} \rightarrow \mathrm{Cu}_{2} \mathrm{I}_{2}(\mathrm{X})+2 \mathrm{~K}_{2} \mathrm{SO}_{4}+\mathrm{I}_{2}$
$2 \mathrm{I}_{2}+2 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} \rightarrow 2 \mathrm{NaI}+\mathrm{Na}_{2} \mathrm{~S}_{4} \mathrm{O}_{6}(\mathrm{Y})$
5. Option (2) is correct.
$\mathrm{Br}_{2}$, alc. $\mathrm{KOH}, \mathrm{NaNH}_{2}, \mathrm{H}_{2}$ /Lindlar's Catalyst

6. Option (2) is correct.

7. Option (3) is correct.

In liquation, the purification of a sample takes place on the basis of difference in the boiling point while in electrolysis the refining of metal hailde or oxide takes place in a molten form to obtain pure metal.
Liquation and Electrolysis are refining techniques.
8. Option (4) is correct.

Protein is a condensation polymer of $\alpha$-amino acids. Hence, upon hydrolysis, proteins give $\alpha$-amino acids.

9. Option (3) is correct.

The electronic configuration of $\mathrm{Nd}(\mathrm{Z}=60)$ : $[\mathrm{Xe}] 4 \mathrm{f}^{4}$ $6 s^{2}$. In the $(+2)$ state, the configuration is $[\mathrm{Xe}] 4 \mathrm{f}^{4}$.

The correct order of radii is: $\mathrm{Ca}^{2+}(\mathrm{Z}=20)<$ $\mathrm{K}^{+}(\mathrm{Z}=19)<\mathrm{Cl}^{-}(\mathrm{Z}=17)<\mathrm{S}^{2-}(\mathrm{Z}=16)$
13. Option (1) is correct.
$\mathrm{X}=\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+},(\mathrm{Y})=\left[\mathrm{CoCl}_{4}\right]^{2-},(\mathrm{Z})=$ Tetrahedral
The $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ when treated with excess HCl (conc.) turns deep blue in color. This is because the complex absorbs an orange light (low-frequency light). This is due to the lower splitting of d-orbitals of $\mathrm{Co}^{2+}$ ions. The tetrahedral complexes have a lower splitting than the octahedral complexes and absorb light of lower frequency. Hence, the geometry of the complex $(\mathrm{Y})$ is tetrahedral.
14. Option (1) is correct.

When $\mathrm{H}_{2} \mathrm{O}_{2}$ acts as a reducing agent, one of the products of the reaction is $\mathrm{O}_{2}$. This is because $\mathrm{H}_{2} \mathrm{O}_{2}$ oxidizes to $\mathrm{O}_{2}$. The oxidation state of oxygen changes to (0) from (-1).

$$
\underset{(-1)}{\mathrm{NaOCl}}+\underset{\mathrm{H}_{2} \mathrm{O}_{2}}{ }+\rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}+\underset{(0)}{\mathrm{O}_{2}}
$$

15. Option (1) is correct.

20. Option (1) is correct.
$n=2$ to $n=1$.
$\frac{1}{\lambda_{H}}=\frac{1}{\lambda_{H e^{+}}}$
$R_{H}\left[\frac{1}{n_{1}^{2}}-\frac{1}{n_{2}^{2}}\right](1)^{2}$

$$
=R_{H}\left[\frac{1}{(2)^{2}}-\frac{1}{(4)^{2}}\right](2)^{2}

$$

$\therefore$ Volume of gas at STP $=4 \mathrm{~L}$
